Another Motivation: later ...

General question:

- x random
- y random
- x and y independent

• Is xy random?

Classical information and algorithmical information

• Shannon entropy, $H(X) = \sum_{x} P(X = x) \log P(X = x)$. Length of the minimal average description of random variable X.

Algorithmical plain complexity, C(x).
 Length of the minimal algorithmical description of individual string x.

Algorithmical prefix-free complexity, K(x).
 Length of the minimal algorithmical prefix-free description of individual string x.

《曰》 《圖》 《臣》 《臣》

Algorithmical (a.k.a Kolmogorov) complexity

Kolmogorov complexity of a string is the length of its shortest description.

- $0\overline{10}1\ldots01$ has a short description.

Algorithmical (a.k.a Kolmogorov) complexity

Kolmogorov complexity of a string is the length of its shortest description.

- 0101...01 has a short description.

Definition:

 $C(x) = \min\{|p| \mid U(p) = x\};$ $C(x \mid y) = \min\{|p| \mid U(p, y) = x\},$ where U is a fixed universal Turing machine.

イロト 不得ト イヨト イヨト

Algorithmical (a.k.a Kolmogorov) complexity

Kolmogorov complexity of a string is the length of its shortest description.

- 0101...01 has a short description.

Definition:

 $C(x) = \min\{|p| \mid U(p) = x\};$ $C(x \mid y) = \min\{|p| \mid U(p, y) = x\},$ where U is a fixed universal Turing machine.

Definition:

$$K(x) = \min\{|p| \mid U(p) = x\};$$

 $K(x \mid y) = \min\{|p| \mid U(p, y) = x\},\$

where U is a fixed **prefix-free** universal Turing machine.

• I(y:x) = quantity of information in y about x.

• Classical information theory: I(Y : X) = H(X) - H(X | Y).

• Algorithmical information theory: I(y : x) = C(x) - C(x | y).

nan

イロト イポト イモト イモト 一日

- Symmetry of Information (classical): I(x : y) = I(y : x).
- Symmetry of Information (algorithmical): $I(x : y) = I(y : x) \pm O(\log n)$.

Sar

< = > < = > < = > < = >

- Symmetry of Information (classical): I(x : y) = I(y : x).
- Symmetry of Information (algorithmical): $I(x : y) = I(y : x) \pm O(\log n)$.
- For some strings x and y, the $\pm O(\log n)$ is necessary.

< = > < = > < = > < = >

- Symmetry of Information (classical): I(x : y) = I(y : x).
- Symmetry of Information (algorithmical): $I(x : y) = I(y : x) \pm O(\log n)$.
- For some strings x and y, the $\pm O(\log n)$ is necessary.
- But for some strings, it is not.
- THEOREM [Z, 2011]. For all strings x and y,

 $I(x:y) \leq I(y:x) + O(\log I(y:x)) + O(C^{(2)}(x \mid n) + C^{(2)}(y \mid n)).$

- Symmetry of Information (classical): I(x : y) = I(y : x).
- Symmetry of Information (algorithmical): $I(x : y) = I(y : x) \pm O(\log n)$.
- For some strings x and y, the $\pm O(\log n)$ is necessary.
- But for some strings, it is not.
- THEOREM [Z, 2011]. For all strings x and y,

$$I(x:y) \leq I(y:x) + O(\log I(y:x)) + O(C^{(2)}(x \mid n) + C^{(2)}(y \mid n)).$$

• COROLLARY. If x and y are random, then

$$I(y:x) = O(1)$$
 IFF $I(x:y) = O(1)$.

The key part of the proof is to analyze $C(xy \mid n)$ vs. $C(x \mid n) + C(y \mid x)$. $w = |C(xy \mid n) - C(x \mid n) - C(y \mid x)|$ We show $w = O(\log I(x : y)) + O(C^{(2)}(x \mid n) + C^{(2)}(y \mid n))$.

We get the **direct product result**:

x random, y random, x and y independent \Rightarrow xy random.

< = > < @ > < E > < E > < E</p>

The key part of the proof is to analyze $C(xy \mid n)$ vs. $C(x \mid n) + C(y \mid x)$. $w = |C(xy \mid n) - C(x \mid n) - C(y \mid x)|$ We show $w = O(\log I(x : y)) + O(C^{(2)}(x \mid n) + C^{(2)}(y \mid n))$.

We get the **direct product result**:

x vandom, y random, x and v independent \Rightarrow xy random.

$$C(x \mid n) = n - O(1)$$
 $I(x : y) = O(1)$

《曰》 《圖》 《臣》 《臣》

The key part of the proof is to analyze $C(xy \mid n)$ vs. $C(x \mid n) + C(y \mid x)$. $w = |C(xy \mid n) - C(x \mid n) - C(y \mid x)|$ We show $w = O(\log I(x : y)) + O(C^{(2)}(x \mid n) + C^{(2)}(y \mid n))$.

We get the **direct product result**:

x random, y random, x and y independent \Rightarrow xy random.

< = > < @ > < E > < E > < E</p>

•
$$t_x = C(x \mid n), t_y = C(y \mid x), t = C(xy \mid n)$$

- We want to estimate $w = t_x + t_y t$
- The construction uses information $\Lambda = (t_x, t_y, w)$
- A can be encoded in a self-delimited way using λ bits, for

$$\lambda \leq 2 \log w + O(\log I(x : y) + C^{(2)}(x \mid n) + C^{(2)}(y \mid n))$$

nac

Build a $2^n \times 2^n$ table, with rows and columns indexed by *n*-bit strings

Color cell (u, v) with 1 if $C(uv | n) \le t$; 0 otherwise.

S = set of 1-cells

 $S_u = \text{set of 1-cells in row } u$

We have $|S| \leq 2^{t+1}$.

Let $2^{m-1} < |S_x| \le 2^m$. F = the set of rows with $> 2^{m-1}$ 1's.

We have $|F| < \frac{|S|}{2^{m-1}} \le 2^{t-m+2}$.

◆□▶ ◆□▶ ◆三▶ ◆三▶ ○○○

THEOREM (Direct product for weak K-randomness) [Z'2012] If $K(x \mid n) \ge n - c$, and $K(y \mid x) \ge n - c$, then $K(xy \mid 2n) \ge 2n - O(c)$.

PROOF(sketch):

Notation: \overline{d} is a self-delimiting encoding of d.

$$S_u(d) = \{ v \mid K(uv \mid n) \leq 2n - 2d \}.$$

$$F(d) = \{u \mid |S_u(d)| \ge 2^{n-d}\}.$$

We construct prefix-free program p_1 using conditional information x (basically enumerating $S_x(d)$).

 p_1 on input $\overline{d}bin(i)$: Check if bin(i) is written on n - d bits. If not, diverge. Else, enumerate strings of length n such that $K(xu \mid n) \leq 2n - 2d$; output the *i*-th such string.

《曰》 《圖》 《臣》 《臣》

If there is *i* such that $p_1(d, i)$ outputs *u*, then $K(u \mid x) \leq n - d + |\overline{d}| < n - c$ (for *d* sufficiently large).

So there is no *i* such that $p_1(d, i)$ outputs *y*.

There are two possible reasons:

(a) $K(xy \mid n) > 2n - 2d$; in this case we are done.

(b) There are 2^{n-d} other strings enumerated before y.

But in case (b), $|S_x(d)| \ge 2^{n-d}$, so $x \in F(d)$.

Note that $|F(d)| \le \frac{2^{2n-2d}}{2^{n-d}} = 2^{n-d}$.

This implies (after some work), $K(x \mid n) < n - d + |\overline{d}| < n - c$, contradiction. So only (a) can happen. QED

Randomness direct product for resource-bounded complexity

• THEOREM (Direct product for space-bounded randomness) If $CS^{s(n)}(x \mid n) \ge n - c$, $CS^{s(n)}(y \mid x) \ge n - c$, then $CS^{\alpha s(n)}(xy \mid n) \ge 2n - O(c)$, for some constant $\alpha > 0$.

 Randomness direct product for time-bounded complexity does not hold (provided one-way permutations exist).

Take y - random, and x = f(y) where f is a one-way permutation. $CT^{poly}(x \mid n) \ge n$, $CT^{poly}(y \mid x) \ge n$, but $CT^{poly}(xy \mid n) \approx n$.

Open problem for time-bounded complexity

Let x and y be such that

 $CT^{\text{poly}}(x \mid y) \ge n, \ CT^{\text{poly}}(y \mid x) \ge n.$

What can we say about $CT^{poly}(xy \mid n)$?

Conjecture: For some x and y, $CT^{poly}(xy \mid n) \ll 2n$.

• Random objects are wonderful (think of random graphs, random strings, ...)

• Randomness is very useful in practice (polls, cryptography, algorithms, games, etc.)

• But how do we get randomness?

< ロ ト < 団 ト < 三 ト < 三 ト</p>

• Randomness cannot be obtained from nothing (entropy cannot be increased).

DQC

Kolmogorov extraction from infinite sequences

• Sources are sequences in $\{0,1\}^{\omega}$.

Quality of randomness: effective Hausdorff dimension dim(x).
 dim(x) = inf C(x i n)/n

• Miller's THEOREM [M'2008] Extraction from one source is impossible. There exists x with dim(x) = 1/2 such that for every Turing reduction f, dim $(f(x)) \le 1/2$.

< = > < @ > < E > < E > < E</p>

Kolmogorov extraction from infinite sequences

• DEFINITION[CaludeZ.08] $x, y \in \{0, 1\}^{\omega}$ are C-independent if for all n, m $C(x \upharpoonright n y \upharpoonright m) \ge C(x \upharpoonright n) + C(y \upharpoonright m) - O(\log n + \log m).$

THEOREM[Z'08] Extraction from two C-independent sources is possible.
 For every rational σ > 0, there exists a tt-reduction f such that for all x, y, if x and y are C-independent, dim(x) ≥ σ, dim(x) ≥ σ, then dim(f(x, y)) = 1.

200

Summary

Randomness direct product:

IF x random, y random, (x, y) independent THEN xy random.

- Holds for strings and plain Kolmogorov complexity randomness (C(x | n) > n − c)
- Holds for strings and weak prefix-free Kolmogorov complexity randomness $(K(x \mid n) > n c)$
- Open for strings and strong prefix-free Kolmogorov complexity randomness $(K(x \mid n) > n + K(n) c)$
- Holds for infinite sequences and Martin-Löf randomness (van Lamabalgen Theorem) (also for Schnorr randomness, constructive randomness)
- Holds for space-bounded Kolmogorov complexity
- Conjecture: Does not hold for poly-time resource bounded Kolmogorov complexity
