

### **Learning Outcomes**

#### Students should be able to:

- Describe the differences between bitmap graphics and vector graphics
- Calculate the size in bytes of a bitmap image
- Compare and contrast different compression methods (jpeg, gif and png)

13/02/2017

COMPSCI 111/111G - Digital Images

### **Bitmap Graphics**

#### Storing pictures digitally

- Sample the image (divide into dots)
- Image resolution (number of dots)

200 x 250

40 x 50

20 x 25

http://en.wikipedia.org/wiki/Raster\_graphics

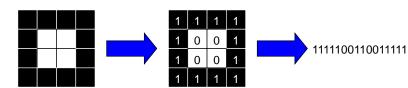

# **Black and White pictures**

#### **Digital Pictures consist of small dots**

Each dot is called a picture element (pixel)

### **Storing information**

- Black and White are only two states
- Use bits to represent pixels (0 = OFF, 1 = ON)
- One to one mapping, so known as Bitmap

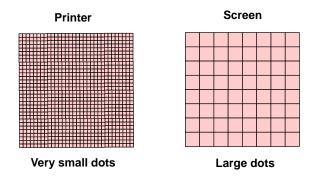

http://en.wikipedia.org/wiki/Pixel

### **Displaying images**

#### Images are displayed on an output device

- Screen / Printer
- Physical devices have limitations

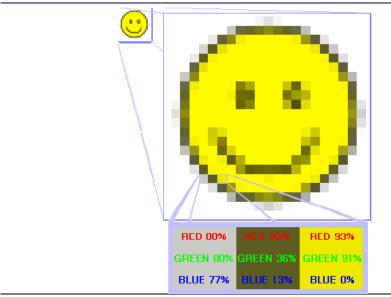

13/02/2017

COMPSCI 111/111G - Digital Images

5

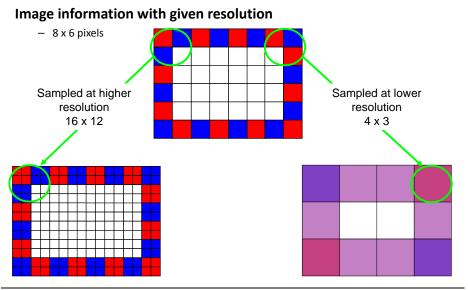

### **Resizing bitmap images**

13/02/2017 COMPSCI 111/111G - Digital Images

6

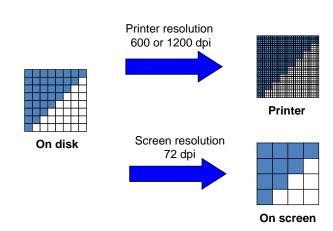

# **Resizing images**

### **Printing Bitmaps**

#### Printer and Screen have different sized dots

- Scale (resample) the bitmap to ensure it looks good on both

#### **Exercises**

Imagine you have taken a picture with a 4 megapixel digital camera. For ease of calculation, assume that the picture is square, not rectangular.

4 million pixels

Assume that you are printing this picture out on a printer that has approximately 4000 dots per inch. How many inches across would the picture be when it was printed?

If you viewed this image on a screen that had 1000 dots across, what portion of the image would be visible?

13/02/2017

COMPSCI 111/111G - Digital Images

9

### **Colour Bitmaps**

#### **Colours**

- Use more than 1 bit per pixel
- Map the binary number to a colour

1100	0010	1111	1111	
1010	0101	0010	1111	
1000	0111	0000	1101	
0110	1111	1110	1010	

Each pixel uses 4 bits

Bits	Colou
0000	Black
0001	Red
0010	Greer
0011	Blue
0100	Yellov

Colour table used for display

COMPSCI 111/111G - Digital Images

10

# How much memory is required?

#### One binary number used for each pixel

- 1 bit	2 colours
- 2 bits	4 colours
<ul> <li>4 bits</li> </ul>	16 colour
<ul> <li>8 bits</li> </ul>	256 colours
<ul><li>16 bits</li></ul>	65536 colours
<ul> <li>24 bits</li> </ul>	16,777,216 colours

How many bits are required for a 16 colour image 100 pixels wide x 8 pixels high?

-100x8x4 = 3200 bits = 400 bytes

An image using 24 bit colour, 1000 wide x 1000 high (1 Megapixel)?

3 MB

### **Exercises**

- How many colours can be represented by 3 bits?
- How many bits are required to represent 128 different colours?
- How much memory would be required to store a black and white image that is 10 pixels high and 5 pixels wide? Show your working.

### **Exercises**

 How much memory (in bytes) would be required to store an image that has 256 different colours and is 3 pixels high and 5 pixels wide? Show your working.

### **Displays**

#### Screens use a combination of Red, Green and Blue lights

- RGB colour

A single pixel at distance

close up

#### Use one byte (8 bits) for each colour

- 256 different levels of red brightness
- 256 different levels of green brightness
- 256 different levels of blue brightness

13/02/2017

COMPSCI 111/111G - Digital Images

13

COMPSCI 111/111G - Digital Images

4.4

### **Compressing Images**

#### Simply reducing number of colours

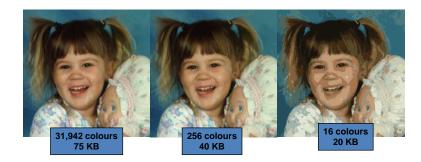

Image is 200 pixels wide, 200 pixels high = 40,000 pixels

### **Compression Algorithms**

### **Graphics Interchange Format (GIF)**

- Lossless method
- 256 colours

13/02/2017

- Good for graphics, poor for photos
- Uses an algorithm that was patented

Image Size: 200x100
Original (256 colours): 20KB
GIF (256 colours): 3KB

 Image Size:
 200x200

 Original (256 colours):
 40KB

 GIF (256 colours):
 32KB

http://en.wikipedia.org/wiki/Gif

### **Compression Algorithms**

#### **Portable Network Graphics (PNG)**

- Replacement to GIF
- Lossless method
- 16 million colours (24 bit)
- Good for graphics, poor for photos

Image Size: 200x100 Original (256 colours): 20KB PNG (16M colours): 4KB

Image Size: 200x200 Original (16M colours): 120KB PNG (16M colours): 68KB

http://en.wikipedia.org/wiki/Png

13/02/2017

COMPSCI 111/111G - Digital Images

### **Compression Algorithms - JPEG**

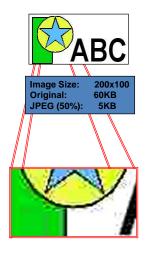

#### Joint Photographic Experts Group (JPEG)

- Lossy method
- 16 Million colours (24 bit)
- Averages nearby colours
- Different degrees of compression
- Good for photos, poor for graphics

JPEG (50%):

http://en.wikipedia.org/wiki/jpeg

13/02/2017

COMPSCI 111/111G - Digital Images

### **Vector Graphics**

### **Object-oriented graphics**

- Objects created independently
- Defined by mathematical formulae

#### **Advantages**

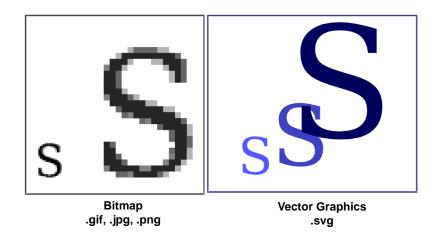

- Very small memory requirements
- Memory independent of the image size
- Scale to any size without loss of quality

Square Object Type: Height: 100 Width: 100 Position\_X: 354 Position Y: 289 Fill Colour: Light Blue

#### http://en.wikipedia.org/wiki/Vector\_graphics

## **Bitmap and Vector Graphics**

COMPSCI 111/111G - Digital Images 13/02/2017 13/02/2017 COMPSCI 111/111G - Digital Images

### **Scalable Vector Graphics**

#### Format for representing vector graphics images

- Open standard created by W3C
- New, gaining popularity
- XML, text file similar to HTML

<?xml version="1.0" encoding="utf-8" standalone="yes"?>
<!DOCTYPE svg PUBLIC "-/W3C//DTD SVG 1.1//EN"
"http://www.w3.org/Graphics/SVG/1.1/DTD/svg11.dtd">

http://en.wikipedia.org/wiki/Svg

13/02/2017 COMPSCI 111/111G - Digital Images

### **Summary**

#### **Bitmap Images**

- Pixel width x pixel height = resolution
- Use numbers to encode colour of each pixel (more colours = more bits per pixel)
- Look jagged when enlarged too much
- Take a lot of memory but can be compressed (e.g. JPG)

#### **Vector Images**

- Defined by mathematical formulae
- · Can be enlarged and still look nice
- Small compared to bitmap images
