Computer Science 210 Computer Systems 1 2007 Semester 1 Lecture Notes Part 2 Instructions & Addressing Modes Lecture 7 30 Mar 07 James Goodman	<section-header><section-header><section-header><section-header><section-header><section-header><section-header><text></text></section-header></section-header></section-header></section-header></section-header></section-header></section-header>	<section-header><section-header><section-header><section-header><section-header><section-header><section-header><section-header><section-header><text></text></section-header></section-header></section-header></section-header></section-header></section-header></section-header></section-header></section-header>
 Base: a long-term but approximate address Gives location of larger structure Can be dynamically varied Displacement Static offset embedded in instruction Cannot be dynamically varied 	Load Reg, Disp(Base) idq Dest Base Displacement 6 bits 5 bits 5 bits 16 bits Effective address: (Base) + Displacement Base is a 64-bit address Displacement is a 16-bit signed constant, sign-extended to 64 bits Displacement defines position <i>relative to</i> Base	Recommended Readings • Today's lecture mostly based on Chapters 4 & 5 of Dr. Hutton's notes.
200007 2200 4 Load Instructions 1 dq reg, disp(base) ! Load quadword 1 dl reg, disp(base) ! Load sign-extended longword 1 dwu reg, disp(base) ! Load zero-extended word	5 2000-07 2000 2000 2000 2000 2000 2000 2	other Possible Addressing Modes • Immediate operand • Instruction contains the value, used as an operand

- Limited by word size to small constant (8 bits)

CS210

9

- Example: addq \$5, 1, \$5
- Example: lda reg, disp(\$31)

 ldq reg, disp(base) 	! Load quadword
 ldl reg, disp(base) 	! Load sign-extended longword
 ldwu reg, disp(base) 	! Load zero-extended word
 ldbu reg, disp(base) 	! Load zero-extended byte
 stq reg, disp(base) stl reg, disp(base) stw reg, disp(base) stb reg, disp(base) 	! Store quadword ! Store longword ! Store word ! Store byte
 lda reg, disp(base) ldah reg, disp(base) 	<pre>! Assign computed addr to reg ! Multiply displacement by ! 65,536 and add to base, ! assign to address</pre>

- Indirect - Instruction contains address where address is held
- Register indirect
- Instruction specifies register where address is held
- Register + Register

 Instruction specifies two registers
 Contents of registers are added to determine address

CS210

8

30-Mar-07

• Base + displacement Instruction specifies register and contains displacement
 Displacement is added to content of register to determine address

30-Mar-07

7

Branch Instruction

- How to specify full add (≤ 53 bits) in a 32-bit instruction?
- · Observation: most branches are short
- Branch can use *relative address*: difference from current value of PC.

CS210

Examples of Operand

Specifications

• Unsigned 8-bit constant (operate instructions)

• Register (operate, control, memory)

• Base + displacement (memory)

• 26-bit constant (PALcode format)

• 21-bit branch offset (control)

• Unsigned 6-bit count (shift instructions)

Example: bne

Long-distance Branches

Register Names

\$to-\$t11	Temporary registers, used to hold temporary values, when evaluating expressions, etc.
\$so-\$s5	Saved registers, used to hold the values of local variables in functions.
\$ao-\$a5	Argument registers, used to pass parameters to functions.
\$vo	Value register, used to return the result of a function.
\$ra	Return address register, used to hold the return address of a function.
\$gp	Global pointer register, used to point to the table of constants.
\$sp	Stack pointer register, used to point to the top of the stack used to allocate space for functions.
\$zero	Zero register, that always contains the value zero. Attempting to write to this register has no effect.
