

THE UNIVERSITY OF AUCKLAND

SEMESTER ONE, 2004

Campus: City and Tamaki

**COMPUTER SCIENCE
TEST**

Principles of Programming

(Time allowed: 75 MINUTES)

NOTE:

- Attempt **ALL** questions
- Write your answers in the space provided
- There is space at the back for answers that overflow the allotted space
- Calculators are **NOT** permitted

Question 1 (20 marks)

- a) What is printed by the following?

```
System.out.println("5" + 5 + 9);
```

(1 mark)

- b) What is printed by the following?

```
System.out.println(6 + 3 + "8");
```

(1 mark)

- c) What is printed by the following?

```
System.out.println((int) 5.3);
```

(1 mark)

- d) What is printed by the following?

```
System.out.println("\n\\n");
```

(2 marks)

SURNAME: FORENAMES:

e) What is printed by the following?

```
System.out.println(5 + 9 % 2 * (10 / 4) - 6);
```

(2 marks)

f) What is printed by the following?

```
System.out.println(5 / 2.0 * 3 / 5);
```

(1 mark)

g) What is printed by the following?

```
String string01 = "food looks good";  
System.out.println(string01.indexOf("oo", 4));
```

(2 marks)

h) What is printed by the following?

```
System.out.println(Math.pow(Math.max(4, 3), 2));
```

(2 marks)

SURNAME: FORENAMES:

i) What is printed by the following?

```
System.out.print((int)3.14159 + "\nis the");  
System.out.print("value of pi.");
```

(2 marks)

j) What is printed by the following?

```
String string02 = "abcdefghij";  
System.out.println(string02.substring(3,string02.length()-3));
```

(2 marks)

k) What is printed by the following?

```
String string03 = " 11 22 33  ";  
String string04 = string03.trim();  
string04+=3;  
System.out.println(string04);
```

(2 marks)

l) What is printed by the following?

```
double number01 = 12;  
int number02 = 5;  
number01 -= number02;  
System.out.println(number01);
```

(2 marks)

SURNAME: FORENAMES:

Question 2 (10 marks)

Consider the following section of Java source code, and answer the questions below:

```
int x = 5;
int y;
char c = 'a';

y = (int)Math.pow(x,2);
Rectangle aRect = new Rectangle(x,y,30,20);
String rectString = "Rect1" + " is " + aRect.toString();
```

- a) List all the *identifiers* which appear in the above code fragment

(5 marks)

- b) Identify all the variables in the above code fragment and categorize them according to whether they are primitive or object types.

PRIMITIVE VARIABLES:

OBJECT VARIABLES:

(5 marks)

SURNAME: FORENAMES:

Question 3 (10 marks)

You need to find and correct five errors in the program Q3. There is no more than one error on each line of code.

The application program Q3 is supposed to generate a random number between 0 and 26, and then print out that number of letters from the alphabet. Three examples of the application being executed are shown below – the output must be *identical* to that shown:

Example 1:

C:\>java Q3

The first 5 characters of the alphabet are abcde

Example 2:

C:\>java Q3

The first 0 characters of the alphabet are

Example 3:

C:\>java Q3

The first 18 characters of the alphabet are abcdefghijklmnopqr

The source code for the application Q3 is given below. Five of the lines of code contain an error of some sort. For each error, you need to clearly circle the error and provide a correction so that the program will compile and execute correctly. You do not need to write out the whole line of source code again, as long as you indicate your corrections clearly.

```
public class Q3 {  
  
    public void main(String[] args){  
  
        String alphabet = "abcdefghijklmnopqrstuvwxyz";  
  
        int index  
  
        index = (int) Math.random() * 27;  
  
        System.out.println("The first " + index + " characters of  
                           the alphabet");  
  
        System.out.println(" are " + alphabet.Substring(0, index));  
  
    }  
  
}
```

(10 marks)

SURNAME: FORENAMES:

Question 4 (15 marks)

Complete the application Q4 given below. Your application should perform the following tasks.

1. Prompt the user to enter two integer values as input.
2. Print the word "Larger:" followed by the larger of the two input integer values.
3. Print the word "Difference:" followed by the difference between the larger and smaller input values.
4. Print the word "Quotient:" followed by the *real* value obtained by dividing the first input value by the second input value.

Two examples of the output that must be produced by your Q4 program are given below. Make sure the output of your application is identical to the format of this output. Values entered by the user are given in bold:

Example 1:

```
C:\>java Q4
Please input first number: 5
Please input second number: 8
Larger: 8
Difference: 3
Quotient: 0.625
```

Example 2:

```
C:\>java Q4
Please input first number: 10
Please input second number: -3
Larger: 10
Difference: 13
Quotient: -3.3333333333333335
```

SURNAME: FORENAMES:

Complete the source code for this application below. Some variables have been declared for you:

```
import java.io.*;

public class Q4 {

    public static void main(String[] args){

        int number1;
        int number2;
        int difference;
        double quotient;
```

*(15 marks)*

```
    }

    private static String readInput() {
        try {
            BufferedReader in = new BufferedReader(
                new InputStreamReader(System.in));
            return in.readLine();
        }
        catch (IOException e) {}
        return "";
    }
}
```

CONTINUED

SURNAME: FORENAMES:

Question 5 (15 marks)

Complete the implementation of the `FruitProfile` class for building simple fruit profiles in a grocery store. The application `Q5` makes use of the `FruitProfile` class as shown below.

```
public class Q5 {  
    public static void main(String[] args) {  
        FruitProfile fruit1 = new FruitProfile("apple", 10);  
        FruitProfile fruit2 = new FruitProfile("pear", 16);  
  
        System.out.println(fruit1.toString());  
        fruit1.add(12);  
        System.out.println("After adding");  
        System.out.println(fruit1.toString());  
  
        System.out.println();  
        System.out.println(fruit2.toString());  
        fruit2.subtract(5);  
        System.out.println("After subtracting");  
        System.out.println(fruit2.toString());  
  
        System.out.println("There are currently " +  
                           fruit1.getAmount() + " " + fruit1.getName() +  
                           "(s) in store." );  
    }  
}
```

The application `Q5` shown above uses the `FruitProfile` class to create two `FruitProfile` objects. When a `FruitProfile` object is constructed, the name of the fruit (a `String`) and the amount in store (an `int`) are both specified. Given a correct implementation of the `FruitProfile` class, the output from the application above should be *exactly* as shown below.

```
C:\>java Q5  
Fruit name: apple  
Amount: 10  
After adding  
Fruit name: apple  
Amount: 22  
  
Fruit name: pear  
Amount: 16  
After subtracting  
Fruit name: pear  
Amount: 11  
There are currently 22 apple(s) in store.
```

SURNAME: FORENAMES:

Complete the implementation of the `FruitProfile` class from the skeleton file given below.

```
public class FruitProfile {  
    // instance variables  
    private String name;  
    private int amount;  
  
    //constructor  
    public FruitProfile(String inputName, int inputAmount){  
          
    }  
}
```

}

(15 marks)

NOTE:

The instance methods that you will need to implement are:

`add( )`: adds input amount to current amount`subtract( )`: subtracts input amount from current amount`getName( )`: returns name of fruit`getAmount( )`: returns amount of fruit`toString( )`: returns String representation of fruit and current amount**CONTINUED**

SURNAME: FORENAMES:

Question 6 (10 marks)**(a)** Evaluate the following boolean expressions**(i)** $(2 > 3) \ || \ (4 == 4) \ \&\& \ !((4 > 5) \ || \ (2 < 3)) \ || \ (9 != 2)$ *(1 mark)***(ii)** $3 == 4 \ \&\& \ 3 != 4 \ || \ !(3 != 3) \ \&\& \ !(4 != 4) \ || \ 5 <= 4$ *(1 mark)***(iii)** $! (! (4 != 6) \ \&\& \ !(5 > 4))$ *(1 mark)***(b)** DeMorgan's Law consists of the following two equivalences:
$$\begin{aligned} !(A \ \&\& \ B) &== !A \ || \ !B \\ !(A \ || \ B) &== !A \ \&\& \ !B \end{aligned}$$
Use DeMorgan's Law to help simplify the following expression. The simplified expression should not contain either of the symbols `!` or `!=` $!(!(x > 42) \ \&\& \ !(x < 13))$ *(3 marks)*

SURNAME: FORENAMES:

(c) Complete the truth table for the following boolean expression

 $P \ \&\& \ Q \ || \ !(P \ || \ Q) \ \&\& \ P$

P	Q	$P \&\& Q$	$P \ \ Q$	$!(P \ \ Q)$	$!(P \ \ Q) \&\& P$	$P \&\& Q \ \ !(P \ \ Q) \&\& P$
T	T					
T	F					
F	T					
F	F					

(4 marks)

SURNAME: FORENAMES:

Question 7 (10 marks)**(a)** Translate the following sentences from English to Java(i) If `a` is less than 7 or `b` is greater than 7 then print out "greater than 7"*(1 mark)*(ii) Print "too easy" unless `finalMark` is less than 50*(1 mark)*(iii) Print "too hard", but only if `finalMark` is less than 50*(1 mark)*(iv) If either `a` or `b` is greater than 8 and if neither `c` nor `d` is less than 8, then print "abcd"*(2 marks)*

SURNAME: FORENAMES:

(b) What is the output of the following code?

```
int x = 4;
int y = 5;
int z = 6;
if(x>y || y>z)
x = 0;
else
if(x<y && y<z)
if(x==y)
z=y;
else
y = 0;
else
if(y==0 || x<z)
z = 0;
System.out.println(x + " " + y + " " + z);
```

(5 marks)

SURNAME: FORENAMES:

Question 8 (5 marks)

Assume that variables *r* and *s* have been declared as follows:

```
Rectangle r = new Rectangle(10, 20, 30, 40);  
Rectangle s = new Rectangle(10, 20, 30, 40);
```

- (i) Write an if statement which will print out "equal value" if *r* is equal *in value* to *s*.

(2 marks)

- (ii) Write an if statement which will print out "equal reference" if *r* is equal *in reference* to *s*.

(2 marks)

- (iii) Are the two variables *r* and *s* equal in reference, equal in value, or both?

(1 mark)

SURNAME: FORENAMES:

Question 9 (5 marks)

What is the output of the following code?

```
int x = 25;
int y = 10;
int count = x;

System.out.println("Before: " + count);

while(count > y){
    if(count%5==0)
        System.out.println(count);
    count--;
}

System.out.println("After: " + count);
```
