Question 1 (12 marks)

a) Complete the output produced by the following code.

```python
num1 = 5
num2 = 4

result = (num2 ** 2 - num1) // 2 / 2 - 1
print("Result: ", result)
```

Result: 1.5

(2 marks)

b) Complete the output produced by the following code.

```python
num1 = 5
num2 = 3
result = str(num1) * (num2 - 1) + "0"
print("Result: ", result)
```

Result: 550

(2 marks)

c) Complete the following statement which assigns a random number which is either 8, 10 or 12 to the variable, number. You can assume that the random module has been imported.

```python
number = random.randrange(8, 13, 2)
```

(2 marks)
d) Complete the output produced by the following code.

```python
message = "Be a voice not an echo!"

another_message = message[5: 9] + message[-3]
print("Letters:", another_message)
```

Letters: voich

(2 marks)

e) Assume that the variables num1 and num2 have been initialised. Write a Python boolean expression which evaluates to True if num2 is an even number and num1 is greater than num2.

```python
num2 % 2 == 0 and num1 > num2
```

(2 marks)

f) Assume that the variables num1 and num2 have been initialised. Write a Python boolean expression which evaluates to True if the absolute difference between num1 and num2 is less than 3.

```python
abs(num1 - num2) < 3
```

(2 marks)
Question 2 (14 marks)

Part a) and part b) refer to the following function:

```python
def function_ifs(a, b, c):
    if a > b and a > c:
        print("A")
    elif not (a > b and a > c):
        print("B")
    else:
        print("C")

    if a > b or a > c:
        print("D")
    elif not(a > b or a > c):
        print("E")

    print("F")
```

a) Give the output produced by the following function call:

```python
function_ifs(4, 6, 8)
```

B
E
F

(4 marks)
b) Give the output produced by the following function call:

```
function_ifs(8, 6, 4)
```

```
A
D
F
```

(4 marks)

c) This question uses the following function:

```python
def mystery1(value1, value2):
    mix_up = value1[0] * value2
    return mix_up
```

Complete the call to the `mystery1()` function so that the output produced by the following code is:

```
letters = mystery1("Cat", 5)
print(letters)
```

Any word starting with the letter, "C".

(3 marks)
d) This question uses the following function:

```python
def mystery2(word):
    length = len(word)
    if length > 3:
        letter1 = word[2]
        letter2 = word[0]
        return letter1 + "*" + letter2 + word[3:]
    return word + word
```

Complete the call to the `mystery2()` function so that the output produced by the following code is:

```python
letters = mystery2("LIKE")
print(letters)
```

Any four letter word starting with the letter, "L" and the third letter and fourth letters, "KE".

(3 marks)
Question 3 (24 marks)

a) Complete the `print_24_hour_time()` function which is passed an integer parameter, `minutes`. The function converts the number of minutes into 24 hour time. The function prints the hour followed by a ":" followed by the minutes.

For example, the following code:

```python
print_24_hour_time(67)
print_24_hour_time(1316)
print_24_hour_time(4614)
```

Prints:

```
1:7
21:56
4:54
```

```python
def print_24_hour_time(minutes):
    hours = minutes // 60
    hours = hours % 24
    mins = minutes % 60
    print(str(hours) + ":" + str(mins))
```

(8 marks)
b) Complete the `remove_from_end()` function which is passed two parameters, a string and an integer. The function removes the number of characters (given by the second parameter) from the end of the string and returns the resulting string. If the number of characters in the string is less than the number of characters to remove, the function returns the string unchanged. For example, the following code:

```python
phrase1 = remove_from_end("Cut_corners", 3)
phrase2 = remove_from_end("Last_straw", 6)
phrase3 = remove_from_end("hot potato", 3)
phrase4 = remove_from_end("Cat", 5)
print(phrase1, phrase2, phrase3, phrase4)
```

prints:

```
Cut_corn Last hot pot Cat
```

def remove_from_end(phrase, num_to_remove):

```python
    length = len(phrase)
    if length < num_to_remove:
        return phrase
    pos = length - num_to_remove
    return phrase[0: pos]
```
c) Complete the `get_little_name()` function which is passed a string parameter, `name`. The function returns a string made up of the first two letters of the name repeated. The function always returns a four character string in which the first letter is an uppercase letter and the last three letters are lowercase characters. You can assume that the parameter string has a length of two or more characters, that the first character is an uppercase character and that the second character is a lowercase character. For example, the following code:

```python
name1 = get_little_name("Zachariah")
name2 = get_little_name("Sigourney")
name3 = get_little_name("Bettina")
name4 = get_little_name("Gilbert")
print(name1, name2, name3, name4)
```

prints:
Zaza Sisi Bebe Gigi

def get_little_name(name):
    little_name = name[0:2]
    little_name += little_name.lower()
    return little_name

(8 marks)
Question 4 (20 marks)

a) What is the output produced by the following section of code?

```python
num = 17
while num > 2:
    num = num - 3
    print(num)
    num = num - 2
```

```
14
9
4
```

b) What is the output produced by the following section of code?

```python
number = 60
counter = 5
for i in range(3, 16, 4):
    number = number - counter
    print(number)
```

```
55
50
45
40
```
c) Convert the following code which uses a for ... in loop into equivalent code which uses a while loop.

```python
total = 100
for number in range(10, 1, -4):
    print(number)
    total = total - number
```

```
number = 10
total = 100
while number > 1:
    print(number)
    total = total - number
    number = number - 4
```

(5 marks)

d) Using the `range()` function, complete the for ... in loop below so that the output, when the code is executed, is:

```
60  55  50  45  40  35  30  25
```

```python
for number in range(60, 20, -5):
    print(number, " ", end = " ")
print()
```

(5 marks)
**Question 5 (18 marks)**

a) Complete the output produced by the following code:

```python
a_list = [4, 2, 1, 3, 0, 5]
print("a_list:", a_list)
```

```
a_list: [4, 5, 1, 1, 0, 5]
```

(4 marks)

b) Complete the output produced by the following code:

```python
a_list = [4, 2, 15]
a_list[0] = a_list[1] * 2
a_list = a_list + [2]
a_list = a_list + [a_list[1]]
print("a_list:", a_list)
```

```
a_list: [4, 2, 15, 2, 2]
```

(4 marks)
a) Complete the `get_evens_list()` function, which returns a new list which contains only the even numbers from the parameter list. For example, executing the following code using the completed function:

```python
a_list1 = [4, 2, 1, 3, 6, 5]
a_list2 = get_evens_list(a_list1)
print("a_list2:", a_list2)
```
gives the output:

```
a_list2: [4, 2, 6]
```

```python
def get_evens_list(a_list):
    list2 = []
    for item in a_list:
        if item % 2 == 0:
            list2 += [item]
    return list2
```

(10 marks)
Question 6 (12 marks)

a) Using the code tracing technique shown in lectures, perform a code trace for the following program and give the output. Give the output in the space below and show the code trace in the space provided on the next page.

```python
def main():
    print("A")
    function1()
    print("B")

def function1():
    print("C")
    first = function2(23)
    print("D", first)
    print("E")

def function2(value):
    num_str = "**" + str(value)
    pos = len(num_str)
    pos = pos - 3
    print("F", pos)
    return num_str[pos:]

main()
```

Give the output:

A
C
F 1
D *23
E
B

(6 marks)
Show the code trace in the space below:

```
function2()
value 23
pos 4 1
num_str "**23"

function1()
first "*23"

main() function
```

(6 marks)
