CompSci 101 - Principles of Programming 1

## CompSci 101 Assignment 3

Due: 4:30pm, May 21

Worth: 3% of your final mark

## **Topic:** lists

## This assignment is marked out of 30

## Assignment 3 – Complete 8 functions

For Assignment 3, I have posted programs containing the skeletons and testing code for the 8 assignment questions. Download these programs from the CompSci 101 assignments website:

https://www.cs.auckland.ac.nz/courses/compsci101s1c/assignments/

Develop the solution to each function in each program.

Once you are happy that a function executes correctly, submit **the whole function** to **CodeRunner3**. You will receive immediate feedback from CodeRunner3 telling you if you have passed the tests for that question. You can submit as many times as you like. You need to submit one function at a time. CodeRunner3 Assignments

Assignment 3 is completely marked on **CodeRunner3**. There is no other submission required.

CompSci 101 Assignment 3

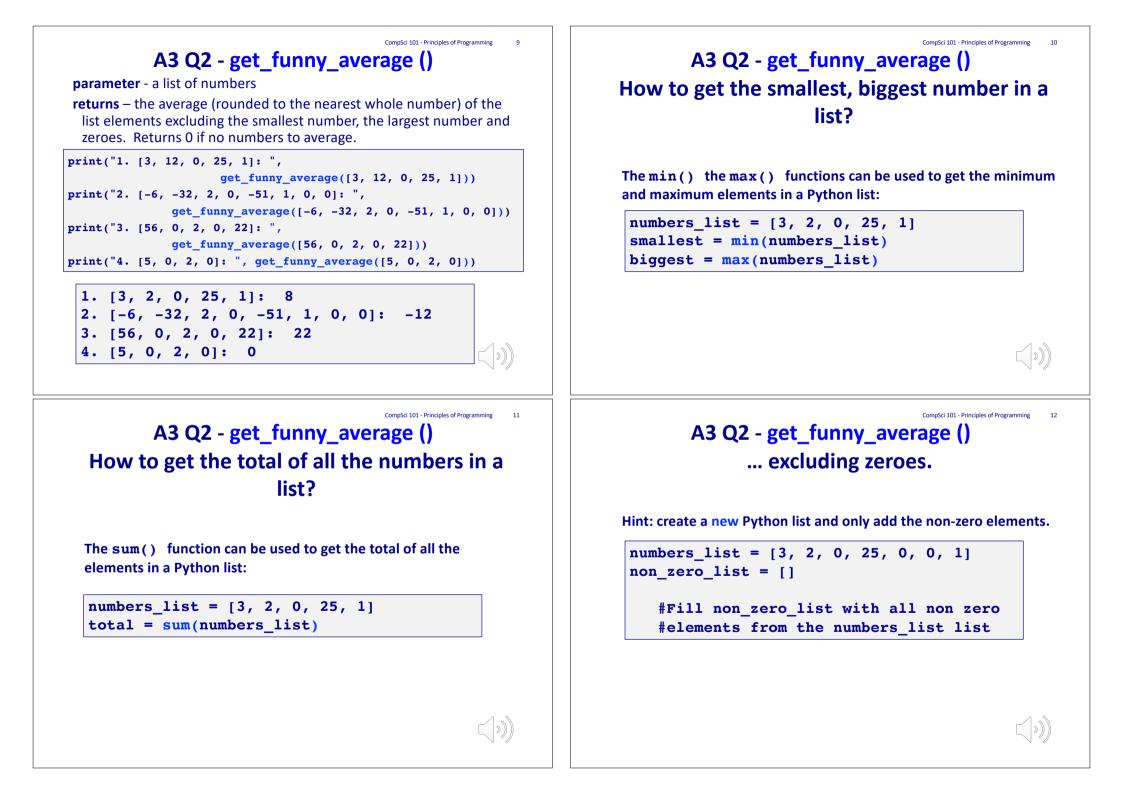

Some helpful information about Questions 1, 2 and 3

CompSci 101 - Principles of Programming CompSci 101 - Principles of Programming A3Q1-get numbers() A3Q1-get numbers() parameters – a list of integers How to create a new list, how to add returns – a new list elements to the new list. Function creates and returns a **new list** containing all the **odd** numbers from the parameter list which are **NOT** exactly divisible by 3. 1. Create an empty Python list: print("1.", get numbers([23, 3, 6, 5, 12, 9, 7, 4])) result list = [] print("2.", get numbers([87, 77, 49, 21, 4, 80, 51])) print("3.", get numbers([9, 30, 27, 36])) print("4.", get numbers([])) 2. Fill the list with the relevant elements using the append() method. Usually this happens over and over, i.e. inside a loop: 1. [23, 5, 7] 2. [77, 49] result list.append(an element) 3. [] 4. [] 3. Usually the filled Python list is returned as a result of the function: return result list CompSci 101 - Principles of Programming CompSci 101 - Principles of Programming A3Q1-get numbers() A3Q1-get numbers() How to test if a number is exactly divisible by Use the append() method to add elements another number. to the end of the list. 1. Check if there is zero remainder when a number is divided by Add a single element to the end of the list using the append() another number, use the % operator method: result list = [] number1 = . . . #some integer number2 = . . . #some integer an element = ... result list.append(an element) if number1 % number2 == 0: #do what is needed if number1 is exactly #divisible by number2

())

()))

CompSci 101 - Principles of Programming A3Q3-get fail pass average() A3 Q2 - get funny average () **parameters** – a list of integers When to return zero. returns – a Python list made up of two elements: Once the list with all the non-zero elements has been created, the the average of all the marks which are less than 50, followed by the smallest and largest elements can be removed. BUT what if the list average of all the marks which are 50 or more (both averages are is empty? What if the list has only one element? What if the list rounded to the nearest whole number). Average is -1 if there are no has only two elements? marks in the category. 4 Examples [5, 2] or [5] or [5, 2, 7] or [] print("1.", get fail pass\_average([63, 65, 33])) print("2.", get fail pass average([63, 62, 100, 100])) def some function(..., ...): print("3.", get fail pass average([33, 42, 20, 10])) print("4.", get fail pass average([])) if condition1: return 0 #stop executing the 1. [33, 64] #function and return 0 2. [-1, 81] 3. [26, -1]4. [-1, -1]#continue the function code knowing that #condition1 is not true CompSci 101 - Principles of Programming 16 CompSci 101 - Principles of Programming A3Q3-get fail pass average() A3Q3-get fail pass average() Average is -1 if there are no marks in the category. Hint: create two lists and add relevant Work out the averages for the two lists. BUT what if either of the elements to each list. lists is empty? Division by 0 will generate an error! list below = [] For Example, [63, 62, 100, 100]list pass = [] list below = []list pass = [] #Either add the element to list below #or to list pass . . . #Work out averages BUT check first in #case the average needs to be set to -1

A3 Q3 - get\_fail\_pass\_average() How to get the total of all the numbers in a list? ... the number of elements in the list?

CompSci 101 - Principles of Programming 17

The sum() function can be used to get the total of all the elements in a Python list. The len() function can be used to get the total of all the elements in a Python list.

numbers\_list = [3, 2, 0, 25, 1]

```
total = sum(numbers_list)
```

```
number_of_elements = len(numbers_list)
```

A3 Q3 - get\_fail\_pass\_average() How to create a Python list made up of two elements:

A Python list can be initialised using square brackets and the initial elements, each separated by commas, e.g.

element1 = . . .
element2 = . . .
element3 = . . .

result\_list = [element1, element2, element3]
