# COMPSCI 111/111G Digital Images and Vector Graphics

Lecture 13 SS 2020

The Seine and La Grande Jatte - Springtime George Seurat 1888

# **Learning Outcomes**

#### Students should be able to:

- Describe the differences between bitmap graphics and vector graphics
- Calculate the size in bytes of a bitmap image
- Compare and contrast different compression methods (jpeg, gif and png)

# Bitmap Graphics

### Storing pictures digitally

- Sample the image (divide into dots)
- Image resolution (number of dots)

200 x 250

40 x 50

20 x 25

https://en.wikipedia.org/wiki/Raster\_graphics

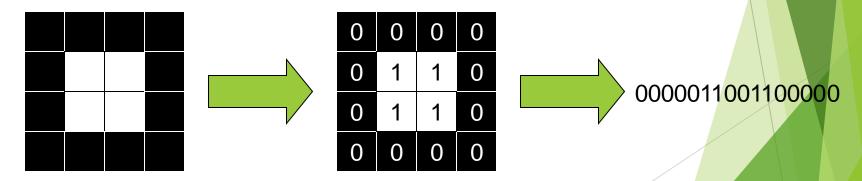

# Black and White pictures

#### Digital Pictures consist of small dots

Each dot is called a picture element (pixel)

#### Storing information

- Black and White are only two states
- Use bits to represent pixels (0 = OFF, 1 = ON)
- One to one mapping, so known as Bitmap

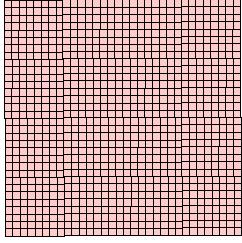

http://en.wikipedia.org/wiki/Pixel

# Displaying images

Images are displayed on an output device

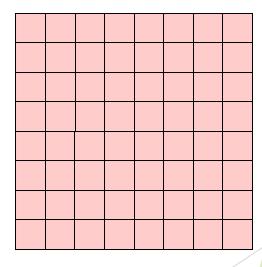

- Screen / Printer
- Physical devices have limitations

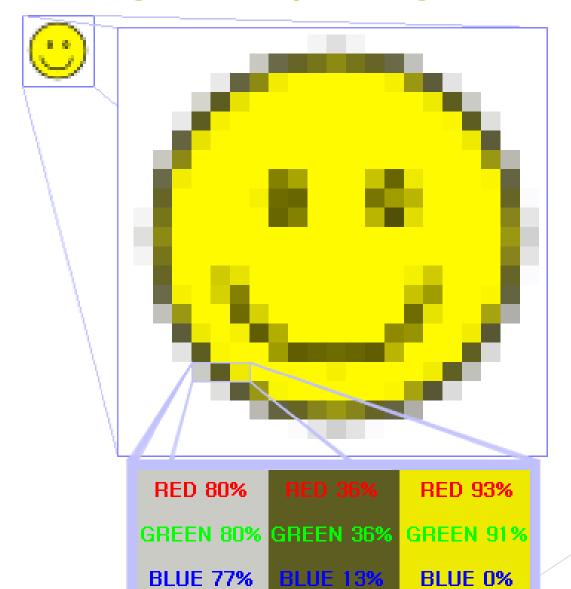

Very small dots

Screen

Large dots

# Resizing bitmap images

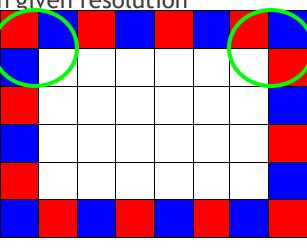

# Resizing images

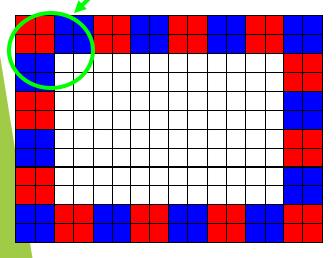

Image information with given resolution

▶ 8 x 6 pixels

Sampled at higher resolution 16 x 12

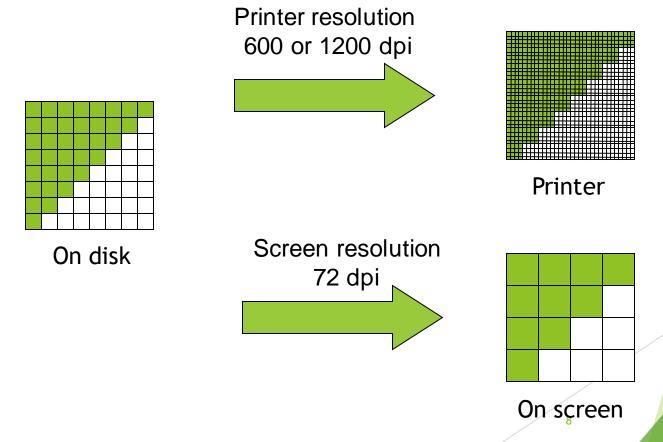

Sampled at lower resolution 4 x 3

# **Printing Bitmaps**

Printer and Screen have different sized dots

Scale (resample) the bitmap to ensure it looks good on both

### **Exercises**

Imagine you have taken a picture with a **4 megapixel** digital camera. For ease of calculation, assume that the picture is **square**, not rectangular.

4 million pixels

Assume that you are printing this picture out on a printer that has approximately **4000 dots per inch**.

A) How many inches across would the picture be when it was printed?

B) If you viewed this image on a screen that had 1000 dots across, what portion of the image would be visible?

# Colour Bitmaps

#### Colours

- Use more than 1 bit per pixel
- ► Map the binary number to a colour

1100	0010	1111	1111
1010	0101	0010	1111
1000	0111	0000	1101
0110	1111	1110	1010

Each pixel uses 4 bits

Bits	Colour
0000	Black
0001	Red
0010	Green
0011	Blue
0100	Yellow

---

Colour table used for display

### How much memory is required?

One binary number used for each pixel

- ▶ 1 bit 2 colours
- 2 bits 4 colours
- ▶ 4 bits 16 colour
- ▶ 8 bits 256 colours
- 16 bits 65536 colours
- 24 bits 16,777,216 colours

How many bits are required for a 16 colour image 100 pixels wide x 8 pixels high?

► 100x8x4 = 3200 bits = 400 bytes

An image using 24 bit colour, 1000 wide x 1000 high (1 Megapixel)?

▶ 3 MB

### **Exercises**

- How many colours can be represented by 3 bits?
- How many bits are required to represent 128 different colours?
- How much memory would be required to store a black and white image that is 10 pixels high and 5 pixels wide? Show your working.

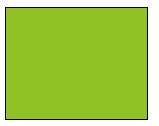

### **Exercises**

How much memory (in bytes) would be required to store an image that has 256 different colours and is 3 pixels high and 5 pixels wide? Show your working.

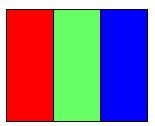

# **Displays**

Screens use a combination of Red, Green and Blue lights

► RGB colour

A single pixel at distance

A single pixel close up

Use one byte (8 bits) for each colour

- 256 different levels of red brightness
- ▶ 256 different levels of green brightness
- 256 different levels of blue brightness

# **Compressing Images**

Simply reducing number of colours

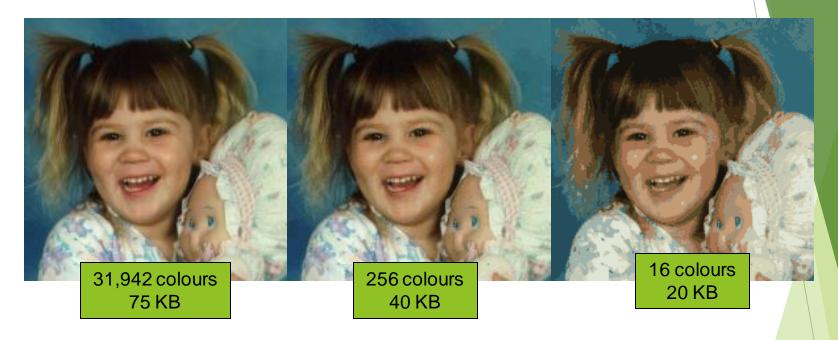

Image is 200 pixels wide, 200 pixels high = 40,000 pixels

# **Compression Algorithms**

Graphics Interchange Format (GIF)

- Lossless method
- ▶ 256 colours
- Good for graphics, poor for photos
- Uses an algorithm that was patented

Image Size: 200x100 Original (256 colours): 20KB GIF (256 colours): 3KB

Image Size: 200x200 Original (256 colours): 40KB GIF (256 colours): 32KB

http://en.wikipedia.org/wiki/Gif

# **Compression Algorithms**

Portable Network Graphics (PNG)

- Replacement to GIF
- Lossless method
- ▶ 16 million colours (24 bit)
- Good for graphics, poor for photos

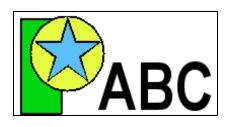

Image Size: 200x100 Original (256 colours): 20KB PNG (16M colours): 4KB

Image Size: 200x200
Original (16M colours): 120KE

PNG (16M colours): 68KB

http://en.wikipedia.org/wiki/Png

### Compression Algorithms - JPEG

Joint Photographic Experts Group (JPEG)

- Lossy method
- ▶ 16 Million colours (24 bit)
- Averages nearby colours
- Different degrees of compression
- Good for photos, poor for graphics

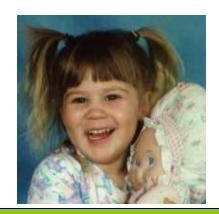

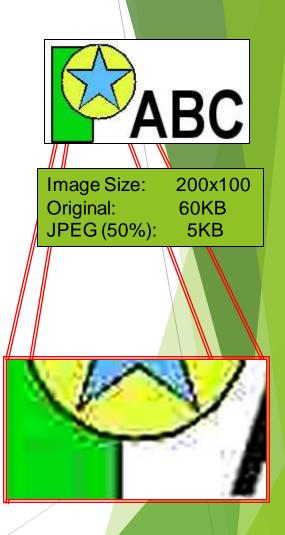

Image Size: 200x200 Original: 120KB JPEG (50%): 6KB

Image Size: 200x200 Original: 120KB JPEG (99%): 2KB

http://en.wikipedia.org/wiki/jpeg

# **Vector Graphics**

Object-oriented graphics

- Objects created independently
- Defined by mathematical formulae

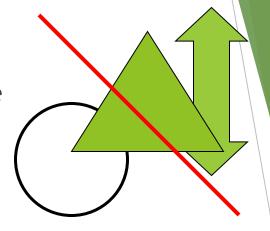

- Very small memory requirements
- Memory independent of the image size
- Scale to any size without loss of quality

Object Type: Square

Height: 100

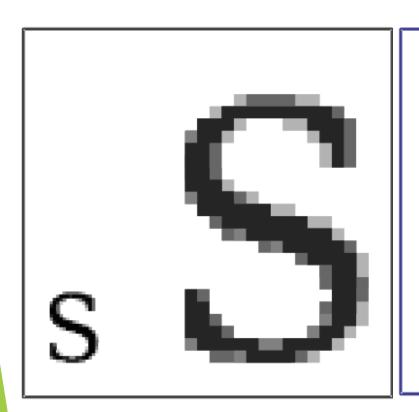

Width: 100 Position\_X: 354 Position Y: 289

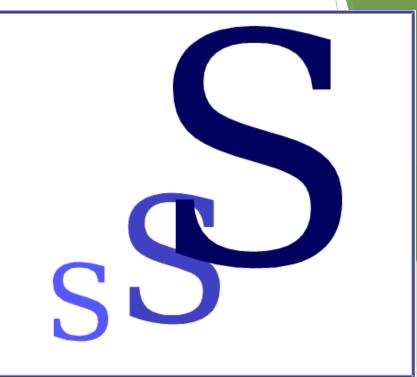

Fill Colour: Light Blue

http://en.wikipedia.org/wiki/Vector\_graphics

# Bitmap and Vector Graphics

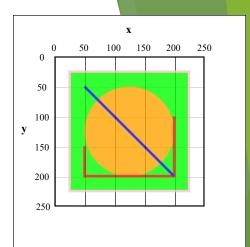

Bitmap .gif, .jpg, .png

Vector Graphics .svg

# Scalable Vector Graphics

Format for representing vector graphics images

- Open standard created by W3C
- New, gaining popularity
- XML, text file similar to HTML

```
1 <?xml version="1.0" encoding="UTF-8" standalone="no"?
2 <!DOCTYPE svg PUBLIC "-//W3C//DTD SVG 1.1//EN" "http://www.w3.org/Graphics/SVG/1.1/DTD/svg11.dtd">

```

## Summary

### Bitmap Images

- Pixel width x pixel height = resolution
- Use numbers to encode colour of each pixel (more colours = more bits per pixel)
- Look jagged when enlarged too much
- Take a lot of memory but can be compressed (e.g. JPG)

### **Vector Images**

- Defined by mathematical formulae
- Can be enlarged and still look nice
- Small compared to bitmap images
