## COMPSCI 320SC 2014 Midterm Test

Attempt all questions. (Use of calculators is NOT permitted.)
Put the answers in the space below the questions. Write clearly and show all your work!
Marks for each question are shown below and just before each answer area.
This 50 minute test is worth $10 \%$ of your final grade for the course.

| Question \#: | 1 | 2 | 3 | 4 | Total |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Possible marks: | 5 | 5 | 5 | 5 | 20 |
| Awarded marks: |  |  |  |  |  |
|  |  |  |  |  |  |

Time Finished:

1. Recall Huffman's greedy algorithm for constructing an optimal prefix code. Consider the behavior of this algorithm on the sample instance with characters $\{a, e, i, o, u\}$ and frequencies $f_{a}=.32$, $f_{e}=.25, f_{i}=.20, f_{o}=.18$ and $f_{u}=.05$.
(a) Draw the Huffman prefix tree for this instance.
(3 marks)
(b) What is the average number of bits per letter (ABL) for this code?
(2 marks)
2. Consider the following divide-and-conquer "algorithm":
function $\operatorname{printer}($ int $n)$
if $n=0$ return
for $j=1$ to 3 do
printline "hello world"
$\operatorname{printer}(\lfloor n / 3\rfloor)$

Let $T(n)$ denote the number of lines of output generated by a call of $\operatorname{printer}(n)$.
(a) Provide a recurrence equation for $T(n)$.
(2 marks)
(b) Solve the recurrence exactly for $n$ being a power of 3 (that is, $n=3^{k}$ for integer $k \geq 0$ ).
3. Suppose you are given an edge-weighted connected graph $G$ of order $n$ and size $m \leq n+10$. You may assume all the edge weights are distinct. Note that for any cycle $C$ in the graph $G$ we know the largest edge weight of $C$ is not used in some minimum spanning tree.
(a) Give a greedy algorithm that finds a minimum spanning tree in time $O(n)$.
(3 marks)
(b) Explain why the algorithm you gave in part (a) is correct and that its running time is linear.
4. Answer each of the following statments as True or False.
(a) The complete bipartite graph $K_{2,5}$ is planar.
(1 mark)
(b) The worst case and average case complexity of the Median-of-Medians algorithm for finding the $k$-th smallest are the same.
(1 mark)
(c) The running time of the Gale-Shapley algorithm for finding a stable matching is in $\Omega\left(n^{2}\right)$, where there are $n$ men and women.
(1 mark)
(d) If the Perrin number $P(n)$ is divisible by $n$ then $n$ is a prime number.
(1 mark)
(e) The complex number $e^{\pi i}=-1$.
(1 mark)
