Ontology 2

Assoc. Prof Ian Watson
CompSci 367

KIF

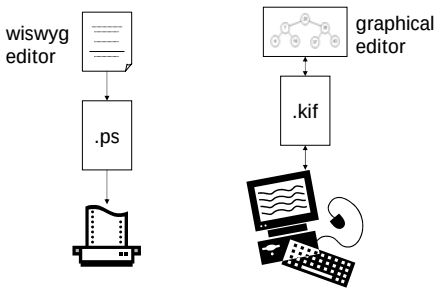
- The Knowledge Interchange Format
  - A computer-oriented language for the interchange of knowledge among disparate programs

http://www-ksl.stanford.edu/knowledge-sharing/kif/

KIF

- Not intended as a primary means of communication with people
- Intended to underpin other representations (graphical, NL, etc)
- Not intended as a direct computational rep.
- Analogous to PostScript as a document description language

KIF analgous to .ps



KIF features

- Declarative semantics – but does not require a specific interpreter (eg unlike Prolog)
- Logically comprehensive – not resricted to Horn clauses like Prolog
- Handles meta-knowledge – allows for explicit K-representations

KIF features

- Translatablity – supports the translation to and from different K-reps
- Readability – not a primary feature but it can be read by people
- Usability – not a primary feature but it can be implemented computationally

KIF syntax

- Overview – look to KIF Manual for details
- 2 forms
  - Linear form (ASCII strings)
  - Structured form (objects)
- Inherited its syntax from LISP

KIF syntax

- *word* is a KIF primitive
  - <word> ::= *a primitive syntatic object*
- *expression* is a word or a finite sequence of expressions
  - <expression> ::= <word> | (<expression>*)
- KIF defines variables, constants operators and relations based upon primitives

KIF syntax

- 4 special types of expression
- Terms
  - Describe objects in the world being described
- Sentences
  - Express facts about the world
- Rules
  - Express inference steps
- Definitions
  - Define constants

KIF syntax

- Forms are sets of terms, sentences, rules and definitions
- A set of forms comprises a knowledge-base
- The set is not ordered
- There is no sequence
  - (declarative not procedural)

KIF conceptualisation

- A universe of discourse is the set of all objects in our world (either real or hypothetical)
- Objects can be *concrete*
  - Lecturer:Ian_Watson, City:Auckland
- Objects can be *abstract*
  - The number 2, the concept of love
- Objects can be *primitive* or *composite*
- Objects can even be *fictional*
  - Person:Batman, Animal:Unicorn

KIF conceptualisation

- Different users of KIF will have different universes of discourse
  - Describe *rugby* and *opera* how many concepts are common?
- KIF is *conceptually promiscuous*
  - No requirement for user to share a universe
- KIF is *conceptually grounded*
  - Does require that users share basic objects

KIF conceptualisation

- These objects occur in all KIF universes
- *words* – KIF words are basic objects
- All complex numbers
- All finite sets of objects in the universe
- ⊥ pronounced “bottom” a special object used where no further meaning can be derived

KIF semantics

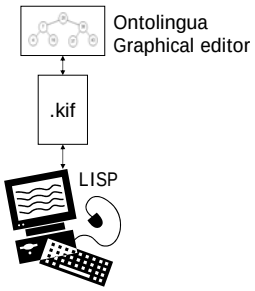
- KIF is a formally defined language
- fairly complex semantics
- Look at the KIF manual for a full definition (resources section of course website)

Ontolingua

- Ontolingua provides a distributed collaborative environment to browse, create, edit, modify, and use ontologies
- The Ontolingua server supports over 150 active users
- An application on top of KIF

www.ksl.stanford.edu/software/ontolingua/

Ontolingua



Ontolingua

- Why develop an ontology
  - To enable a machine to use the knowledge in some application.
  - To enable multiple machines (agents) to share their knowledge.
  - To help yourself understand some area of knowledge better.
  - To help other people understand some area of knowledge.
  - To help people reach a consensus in their understanding of some area of knowledge.

Ontolingua – design method

- Describe the general subject area of your ontology, including any simplifying assumptions you are making
- List what you would like to state in the ontology
- List the concepts that you think should be included in the ontology.
- Look for ontologies in the library that may contain terms which you can use to develop your ontology.
- Review and make modifications to your lists as needed throughout these steps.

Ontolingua – tutorial

- A good online tutorial is available at:

www.ksl.stanford.edu/software/ontolingua/

  - Develops an ontology for used car (vehicle) sales
  - Shows that a new ontology can build on previous ontologies – reuse
  - Guides you through the creation processes

Ontolingua – users

- Ontologies for e-commerce – related to the semantic web initiative
  - Goal is to create a machine readable common language for information exchange on the web
  - Enable applications to understand each others terms
  - Eg web search for "*football*" is that NZ rugby football, US football, or global football (i.e. soccer)

www.w3.org/DesignIssues/Semantic.html

Ontolingua – users

- Ontologies for business process modelling
  - Goal is to create a common language for descison making in business

www.aiai.ed.ac.uk/~entprise/

Ontolingua – users

- Medical ontologies
- Military ontologies
- Academic ontologies

Cyc

- A huge ontology
- Over 1,000,000 assertions (rules)
- Handbuilt over 15 years
- Particular emphasis on "common sense" knowledge
- Run by Doug Lenat an AI pioneer

http://www.cyc.com/

Cyc

- Cyc is a commercial product
- The Upper-Cyc ontology is in the public domain
- ~5,000 terms are defined
- Represent the most common terms in the human perceptual universe
- Maps to CycL a 1st order predicate calculus

Cyc

- The authors claim that Cyc is:
  - *Universal* – any concept real or imaginary can be found an appropriate place in the Cyc ontology
  - *Articulate* – distinctions within the ontology between concepts are both necessary and sufficient

Cyc syntax

- For each concept Cyc lists
  - The Cyc name for the concept
  - an English comment on the intended meaning and use of the concept
  - a few of the taxonomic "links" which Cyc uses to hierarchically order and interconnect its concepts

Cyc syntax

- each concept is represented by a Cyc *term* (denoted by #$Term)
- The Cyc name for the concept
- an English comment on the intended meaning and use of the concept
- a few of the taxonomic "links" which Cyc uses to hierarchically order and interconnect its concepts

Cyc syntax

#$Skin
A (piece of) skin serves as outer protective and tactile sensory covering for (part of) an animal's body. This is the collection of all pieces of skin. Some examples include #$TheGoldenFleece (representing an entire skin of an animal) and (#$BodyPartFn #$YulBrynner #$Scalp) (representing a small portion of his skin).
isa: #$AnimalBodyPartType
genls: #$BiologicalLivingObject #$AnimalBodyPart #$SheetOfSomeStuff #$VibrationThroughAMediumSensor #$TactileSensor

Cyc syntax

- Collections
  - a concept representing a set or class of things with some properties in common,
  - generally what is thought of as "a natural kind."
  - #$Skin is a collection – the set of all full or partial skins

Cyc syntax

- Cyc Relations (predicates and functions)

#$mother : <Animal> <FemaleAnimal>
(#$mother ANIM FEM) means that the #$FemaleAnimal FEM is the female biological parent of the #$Animal ANIM.
isa: #$FamilyRelationSlot #$BinaryPredicate

- #$mother is a relation (a predicate) (notice lower case "m")
- <Animal> is an arguement

Cyc syntax

- Cyc Relations (predicates and functions)
- Functions are similar except they return
  - True or False
  - a term
  - or a collection

Cyc basic vocabulary

#$Thing
#$Thing is the universal set: the collection of everything! Every Cyc constant in the Knowledge Base is a member of this collection; in the prefix notation of the language CycL, we express that fact as (#$isa CONST #$Thing). Thus, too, every collection in the Knowledge Base is a subset of the collection #$Thing; in CycL, we express that fact as (#$genls COL #$Thing). See #$isa and #$genls for further explanation of those relationships. Note: There are even a few collections, such as #$CharacterString and #$Integer, which have a #$defnSufficient that recognizes non-constants (such as strings and numbers) as instances of #$Thing.
isa: #$Collection
some subsets: #$Path-Generic #$Intangible #$Individual #$SimpleSegmentOfPath #$Path-Simple #$MathematicalOrComputationalThing #$IntangibleIndividual #$Product #$TemporalThing #$SpatialThing #$Situation #$EdgeOnObject #$FlowPath #$ComputationalObject #$Microtheory (plus 1488 more public subsets, 13568 unpublished subsets)

Upper-Cyc covers

- Time and Dates
- Spatial Relations
- Quantities
- Mathematics
- Contexts
- Groups
- "Doing"
- Transformations
- Changes Of State
- Transfer Of Possession
- Movement
- Parts of Objects
- Composition of Substances
- Agents
- Organizations
- Actors
- Roles
- Professions
- Emotion
- Social
- Biology
- Chemistry
- Physiology
- General Medicine
- Materials
- Waves
- Devices
- Construction
- Financial
- Food
- Clothing
- Weather
- Geography
- Transportation
- Information
- Perception
- Agreements
- Linguistic Terms
