Definition

- Ontology
 - (1): a science or study of being; specifically, a branch of metaphysics relating to the nature and relations of being. (2): a particular system according to which problems of the nature of being are investigated.
 - a theory concerning the kinds of entities and specifically the kinds of abstract entities that are to be admitted to a language system.

Webster's 3rd. New International Dictionary

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz 3

4

Definition

- **Ontology**
 - (1): a science or study of being: specifically, a branch of metaphysics relating to the nature and relations of being. (2): a particular system according to which problems of the nature of being are investigated.
 - a theory concerning the kinds of entities and specifically the kinds of abstract entities that are to be admitted to a language system.
- language -> communication & understanding

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz

5

Why?

- If people or agents are to communicate they must share a common understanding
- "Waiter, that was a beautiful duck, please get me the bill"
- The elephant stood on the table, it broke!

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz

6

Why?

- Understanding means we share the meaning of words or concepts
 - Red, tiger, ocean, love, mother...
- Understanding also needs common sense
 - Which is quicker, a *fast* car or a *fast* plane?

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz

7

Why?

- Ontologies deal with defining concepts and relations
- Conceptual graphs, KIF, Ontolingua, commonKADS, ...
- They are a dictionary
- They can also be used to define problem solving K and common sense K

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz 7

8

Why?

- An ontology is a formal description of the concepts and relations shared by a community of agents
- Like a formal specification of a program

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz 8

9

An example

- Mother
 - An animal that is the female parent of children
- Animal
 - A living thing – contains DNA
- Living
 - A temporary state for some things requiring energy
- Thing
 - An atomic concept

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz 9

10

An example

- Mother from the CYC ontology
 - `#$biologicalMother` :
`<#$Animal><#$FemaleAnimal>`
`(#$biologicalMother OFFSPRING FEMALE)`
 means that `#$FemaleAnimal FEMALE` is the female biological parent of the `#$Animal OFFSPRING`.

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz 10

11

An example

- `#$Animal`
 - The collection of all animals; this large class of organisms is one instance of `#$BiologicalKingdom`. Animals are typically motile, living, whole organisms; they are elements of `#$Heterotroph`, incapable of performing instances of `#$Photosynthesis`. Animal cells contain cholesterol and lack cell walls made of cellulose. `#$Person` is a subset of `#$Animal`

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz 11

12

A problem

- These definitions necessarily bottom out in expressions containing undefinable primitive atomic concepts
- We provide the *meaning*
- This is *The Chinese Room* problem identified by Searle
- The computer does not *understand* the symbols it manipulates

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz 12

13

The University of Auckland

The Knowledge Level

- Allen Newell (1982)
AI Vol. 18 pp. 87-127

abstraction ↑

- Knowledge Level (goals, actions...)
- Program (symbol) Level (data, commands)
- Logic Level (bits)
- Circuit Level (current, voltage)
- Device Level (electrons)

↓ to write a program you do not need to instruct electrons where to go

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz 13

14

The University of Auckland

The Knowledge Level

- To describe K you do not need to use a specific programming language

Each level can be reduced to the one below ↓

- Knowledge Level (goals, actions...)
- Program (symbol) Level (data, commands)
- Logic Level (bits)
- Circuit Level (current, voltage)
- Device Level (electrons)

↓ But we do not need to worry how it is implemented

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz 14

15

The University of Auckland

The Knowledge Level

- Newell's principle of rationality:
"if an agent has knowledge that one of its actions will lead to one of its goals, then the agent will select that action"
- A direct relation to autonomous intelligent agents
- Thus the goals and K of agents are described at the Knowledge Level

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz 15

16

The Knowledge Level

- Knowledge:
"whatever can be ascribed to an agent, such that it's behavior can be computed according to the principle of rationality"
- K is characterised functionally in terms of what an agent does, not how it is represented (encapsulation)

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz 16

17

The Knowledge Level

- We require a K Level representation to describe the K and goals of our agents
- Allow our agents to communicate
- And perform according to the principle of rationality

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz 17

18

Declarative Programming?

- AI programs commonly contain K written as statements of fact
 - conventional programs describe procedures for manipulating data (for, until, while...)
- In Prolog
 - `mother(X,Y):- female(X), parent(X,Y).`
 - X is the Mother of Y if X is Female and X is the Parent of Y.

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz 18

19

Declarative Programming

- Prolog (Programming in Logic) is an implementation of Predicate Calculus
- all basket ball players are tall
 $\forall X (\text{basketball_player}(X) \Rightarrow X(\text{tall}))$
- some people like brussel sprouts
 $\exists X(\text{person}(X) \Rightarrow \text{likes}(X, \text{sprouts}))$

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz 19

20

Declarative Programming

- Why not use Logic as our ontological K level language?
- logic is hard to read – even for computer scientists
- Some statements are hard to express
 - “everyone loves someone”
- Poor communication medium

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz 20

21

K & Communication

- Which is easier to understand?
 - isa(house,building).
 - isa(slates,covering).
 - isa(tiles,covering).
 - partof(substructure,building).
 - partof(superstructure,building).
 - partof(roof,superstructure).
 - hasa(covering,roof).
 - hasa(area,roof).

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz 21

22

The University of Auckland

K & Communication

- Which is easier to understand?

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz 22

23

The University of Auckland

K & Communication

- Prolog can be represented graphically
- Prolog is logic
- Therefore logic can be represented graphically
- As Semantic networks

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz 23

24

The University of Auckland

K & Communication

- Semantic networks range from ad hoc partially formalised representations using simple labels (isa, hasa, partof)
- To formal representations such as Conceptual Graphs

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz 24

25

KIF

- The Knowledge Interchange Format
 - A computer-oriented language for the interchange of knowledge among disparate programs

<http://www-ksl.stanford.edu/knowledge-sharing/kif/>

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz 25

26

KIF

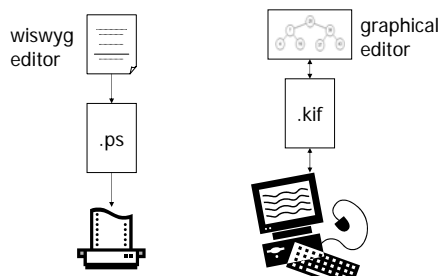

- Not intended as a primary means of communication with people
- Intended to underpin other representations (graphical, NL, etc)
- Not intended as a direct computational rep.
- Analogous to PostScript as a document description language

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz 26

27

KIF analgous to .ps

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz 27

28

KIF features

- Declarative semantics – but does not require a specific interpreter (eg unlike Prolog)
- Logically comprehensive – not restricted to Horn clauses like Prolog
- Handles meta-knowledge – allows for explicit K-representations

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz 28

29

KIF features

- Translatability – supports the translation to and from different K-reps
- Readability – not a primary feature but it can be read by people
- Usability – not a primary feature but it can be implemented computationally

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz 29

30

KIF syntax

- Overview – look to KIF Manual for details
- 2 forms
 - Linear form (ASCII strings)
 - Structured form (objects)
- Inherited its syntax from LISP

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz 30

31

KIF syntax

- *word* is a KIF primitive
 - $\langle \text{word} \rangle ::= \text{a primitive syntactic object}$
- *expression* is a word or a finite sequence of expressions
 - $\langle \text{expression} \rangle ::= \langle \text{word} \rangle \mid (\langle \text{expression} \rangle^*)$
- KIF defines variables, constants operators and relations based upon primitives

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz 31

32

KIF syntax

- 4 special types of expression
- Terms
 - Describe objects in the world being described
- Sentences
 - Express facts about the world
- Rules
 - Express inference steps
- Definitions
 - Define constants

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz 32

33

KIF syntax

- Forms are sets of terms, sentences, rules and definitions
- A set of forms comprises a knowledge-base
- The set is not ordered
- There is no sequence
 - (declarative not procedural)

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz 33

34

KIF conceptualisation

- These objects occur in all KIF universes
- *words* – KIF words are basic objects
- All complex numbers
- All finite sets of objects in the universe
- ⊥ pronounced “bottom” a special object used where no further meaning can be derived

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz 34

35

KIF semantics

- KIF is a formally defined language
- fairly complex semantics
- Look at the KIF manual for a full definition (resources section of course website)

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz 35

36

Ontolingua

- Ontolingua provides a distributed collaborative environment to browse, create, edit, modify, and use ontologies
- The Ontolingua server supports hundreds of users
- An application on top of KIF

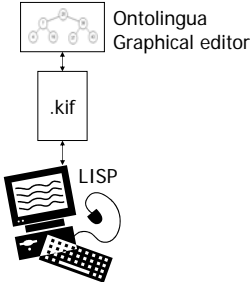

www.ksl.stanford.edu/software/ontolingua/

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz 36

37

Ontolingua

Ontolingua
Graphical editor

.kif

LISP

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz 37

38

Ontolingua

- Why develop an ontology
 - To enable a machine to use the knowledge in some application.
 - To enable multiple machines (agents) to share their knowledge.
 - To help yourself understand some area of knowledge better.
 - To help other people understand some area of knowledge.
 - To help people reach a consensus in their understanding of some area of knowledge.

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz 38

39

Ontolingua – design method

- Describe the general subject area of your ontology, including any simplifying assumptions you are making
- List what you would like to state in the ontology
- List the concepts that you think should be included in the ontology.
- Look for ontologies in the library that may contain terms which you can use to develop your ontology.
- Review and make modifications to your lists as needed throughout these steps.

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz 39

40

Ontolingua – tutorial

- A good online tutorial is available at:
www.ksl.stanford.edu/software/ontolingua/
 - Develops an ontology for used car (vehicle) sales
 - Shows that a new ontology can build on previous ontologies – reuse
 - Guides you through the creation processes

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz 40

41

Ontolingua – users

- Ontologies for e-commerce – related to the semantic web initiative
 - Goal is to create a machine readable common language for information exchange on the web
 - Enable applications to understand each others terms
 - Eg web search for "*football*" is that NZ rugby football, US football, or global football (i.e. soccer)

www.w3.org/DesignIssues/Semantic.html

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz 41

42

Ontolingua – users

- Ontologies for business process modelling
 - Goal is to create a common language for descision making in business

www.aiai.ed.ac.uk/~entprise/

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz 42

43

Ontolingua – users

- Medical ontologies
- Military ontologies
- Academic ontologies

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz 43

44

Cyc

- A huge ontology
- Over 1,000,000 assertions (rules)
- Handbuilt over 15 years
- Particular emphasis on “common sense” knowledge
- Run by Doug Lenat an AI pioneer

<http://www.cyc.com/>

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz 44

45

Cyc

- Cyc is a commercial product
- The Upper-Cyc ontology is in the public domain
- ~5,000 terms are defined
- Represent the most common terms in the human perceptual universe
- Maps to CycL a 1st order predicate calculus

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz 45

46

Cyc

- The authors claim that Cyc is:
 - *Universal* – any concept real or imaginary can be found an appropriate place in the Cyc ontology
 - *Articulate* – distinctions within the ontology between concepts are both necessary and sufficient

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz 46

47

Cyc syntax

- For each concept Cyc lists
 - The Cyc name for the concept
 - an English comment on the intended meaning and use of the concept
 - a few of the taxonomic "links" which Cyc uses to hierarchically order and interconnect its concepts

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz 47

48

Cyc syntax

- each concept is represented by a Cyc *term* (denoted by # $\$$ Term)
- The Cyc name for the concept
- an English comment on the intended meaning and use of the concept
- a few of the taxonomic "links" which Cyc uses to hierarchically order and interconnect its concepts

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz 48

49

Cyc syntax

#\$Skin
 A (piece of) skin serves as outer protective and tactile sensory covering for (part of) an animal's body. This is the collection of all pieces of skin. Some examples include **#\$TheGoldenFleece** (representing an entire skin of an animal) and **(\$BodyPartFn \$YulBrynner \$Scalp)** (representing a small portion of his skin).
isa: **#\$AnimalBodyPartType**
gens: **#\$BiologicalLivingObject \$AnimalBodyPart \$SheetOfSomeStuff \$VibrationThroughAMediumSensor \$TactileSensor**

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz 49

50

Cyc syntax

- Collections
 - a concept representing a set or class of things with some properties in common,
 - generally what is thought of as "a natural kind."
 - **#\$Skin** is a collection – the set of all full or partial skins

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz 50

51

Cyc syntax

- Cyc Relations (predicates and functions)
 - #\$mother** : **<Animal>** **<FemaleAnimal>**
(\$mother ANIM FEM) means that the **#\$FemaleAnimal FEM** is the female biological parent of the **#\$Animal ANIM**.
isa: **#\$FamilyRelationSlot \$BinaryPredicate**
 - **#\$mother** is a relation (a predicate) (notice lower case "m")
 - **<Animal>** is an argument

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz 51

52

Cyc syntax

- Cyc Relations (predicates and functions)
- Functions are similar except they return
 - True or False
 - a term
 - or a collection

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz 52

53

Cyc basic vocabulary

#SThing
 #SThing is the universal set: the collection of everything! Every Cyc constant in the Knowledge Base is a member of this collection; in the prefix notation of the language CycL, we express that fact as (#Sisa CONST #SThing). Thus, too, every collection in the Knowledge Base is a subset of the collection #SThing; in CycL, we express that fact as (#Sgens COL #SThing). See #Sisa and #Sgens for further explanation of those relationships. Note: There are even a few collections, such as #SCharacterString and #SInteger, which have a #SdefnSufficient that recognizes non-constants (such as strings and numbers) as instances of #SThing.
isa: #SCollection
some subsets: #SPath-Generic #SIntangible #SIndividual #SSimpleSegmentOfPath #SPath-Simple #SMathematicalOrComputationalThing #SIntangibleIndividual #SProduct #STemporalThing #SSpatialThing #SSituation #SEdgeOnObject #SFlowPath #SComputationalObject #SMicrotheory (plus 1488 more public subsets, 13568 unpublished subsets)

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz 53

54
