The University of Auckland

Conversational CBR

- CBR systems that engage in a dialogue (conversation) with users
- Used for shallow diagnosis, product selection, planning.
- Main money earner for CBR
- *CBR-lite*
 - just similarity based retrieval
 - no revision

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz

Conversational CBR

- Pioneer was Inference Corp. with CBR-Express (1993) (*copied* by others)
 - System lets user create a natural language query
 - Query is matched against case descriptions
 - Matching cases retrieved and confirming questions asked of user (conversation)
 - Uses information gain to order questions
 - Conversation stops when a case's confidence passes a threshold value
- Case are "authored" not "programmed"

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz

Conversational CBR

- Demo of Help!CPR from The Haley Enterprise
- www.haley.com

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz

Conversational CBR

- Cases comprise
 - Textual description
 - Set of confirming questions
 - Solution or Action
- Natural language query is matched against case descriptions
 - Uses simple textual comparison
 - Keywords, *trigram* matching
 - Lexicons, thesauruses & concept hierarchies

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz

Trigram matching

- Word are broken into sets of three letters
- paper = $[[p,a,p],[a,p,e],[p,e,r]]$
- piper = $[[p,i,p],[a,p,e],[p,e,r]]$
 - approx. similarity = 0.88
- Very good for simple typos
 - Letter transposition

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz

Trigram matching

- A trigram space is constructed from all possible trigram combinations of uppercase letter (26^3)
- A string corresponds to a point in the trigram space where its position along each of the 26^3 dimensions represents a constituent trigram
- A sophisticated indexing technique called "Probably Close" indexing folds this high dimensionality down into an index of lower dimensionality (cf. trigram matching.pdf)

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz

Conversational CBR

- Similar cases are retrieved based upon similar descriptions
- An information gain algorithm calculates which question best discriminates between the cases
- A question's answer alters the confidence (score) of a case
- Questioning continues until a case's confidence exceeds a threshold
- Or all cases have been excluded

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz

Conversational CBR

- Cases are authored not programmed
- Unlike simple rule-based systems diagnostic systems
- Anyone who can use MS Excel can author cases.
- Significant advantage to end-user companies

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz

Conversational CBR

- Advantages over decision trees
 - Questions are not presented in a fixed order
 - Order is dynamically created at query time
 - Questions do not have to be answered
 - Solutions are available at all times (any-time problem solver)
 - Editing & creating cases is simple – they are independent of each other (unlike a decision tree)

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz

Case representation

- Representation depends on:
 - Requirements of domain and task
 - Structure of available case data
- Flat feature-value list (like a database record)
 - Simple case structure is sometimes sufficient for problem solving
 - Easy to store and retrieve in a CBR system
 - Suitable for shallow technical diagnosis, product recommendation

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz

Case representation

- Object-oriented representations
 - Case: collection of objects (instances of classes) in the sense of OO
 - Required for complex and structured objects
- For special tasks:
 - Graph representations: case = set of nodes and arcs
 - Plans: case = (partially) ordered set of actions
 - Predicate logic: case = set of atomic formulas

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz

Case representation

- Flat case representations
- Cases are typically stored in a database
- Two types of case-base
 - Homogenous
 - Heterogenous

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz

Case representation

- Homogenous case-bases:
 - All cases contain the same feature-value pairs (note some values may not be known)
 - ie they share the same record structure
 - Houses in a real estate case-base
 - Cars in a car dealer's case-base
 - Easy to define a full and sufficient set of case features

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz

Case representation

- Heterogenous case-bases:
 - Cases share some feature-value pairs
 - Cases have some different feature-value pairs
 - Difficult/impossible to define a full and sufficient set of case features
 - Medical record: impossible to define all possible symptoms, tests, diseases, treatments, etc...a person may have

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz

Case representation

- OO representation (structural CBR)
 - A case consists of a set of objects
 - Objects described by a set of features
 - Relations between objects (e.g. part-of)
 - Each object belongs to an object-class.
 - Object-classes are organized in a inheritance hierarchy.
 - Case representation language CASUEL (developed by INRECA project)

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz

Case representation

- OO representation (structural CBR)

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz

Case vocabulary

- Case vocabulary means the features that describe a case
- Sometimes called the case index
 - Do NOT confuse with indexing cases for computational efficiency
- Case features (vocab.) should be:
 - Predictive (ie relevant to retrieval)

Case vocabulary

- Case features are:
 - Indexed
 - Unindexed

<p>Patient Ref #: 1024 Patient Name: John Doe Address: 12 Elm Street Next of Kin: Jane Doe Photo: </p>	<p>— unindexed features</p>
<p>Age: 53 Sex: Male Weight: 225 lbs Height: 5' 11" Blood Type: A neg. ...</p>	<p>— indexed features</p>

Case vocabulary

- Indexed features are:
 - used for retrieval
 - are predictive of the case's solution
- Unindexed feature are:
 - not used for retrieval
 - not predictive of the case's solution
 - provide valuable contextual information and lessons learned
- Features can change status

Similarity ???

- Purpose of similarity, either:
 - Select cases that can be adapted easily to solve the current problem
 - Select cases that have (nearly) the same solution to the current problem
- Basic assumption:
 - similar problems have similar solutions

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz

Similarity ???

- Degree of similarity = utility or reusability of the solution
- Similarity is an a-priori approximation of reusability
- Goal of similarity modelling:
 - provide a good approximation
 - close to real reusability
 - And easy to compute

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz

Similarity ???

- Assumptions
 - 2 similar problem descriptions have similar solution descriptions
 - It is easier to adapt the solution of a similar problem than the solution of a less similar problem

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz

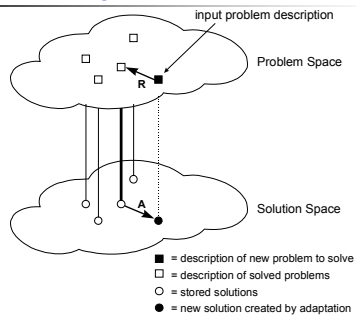

Similarity ???

- Assumptions
 - 2 similar problem descriptions have similar solution descriptions
 - It is easier to adapt the solution of a similar problem than the solution of a less similar problem

Modeling similarity

- Different approaches depending on case representation
- Similarity measures (metrics):
 - Functions to compare two cases:
 $sim(Case_1, Case_2) \rightarrow [0..1]$
 - Local similarity measure: similarity on feature level
 - Global similarity measure: similarity on case or object level
 - combines local similarity measures
 - takes care of different importance of attributes (weights)

© University of Auckland www.cs.auckland.ac.nz/~ian/ ian@cs.auckland.ac.nz

Modeling similarity

- Different approaches depending on case representation:
 - (Sub-)Graph isomorphism for graph case-representations
 - Logical inferences
